

Annotation guidelines

Export reading guide and portfolio checks

[Watch Joy's annotated video on Google Drive](#)

Document status

This guide explains the saved export and the portfolio checks. The original DataLens assignment rules were not supplied. This document does not replace them.

Read the saved data

1. Keep the source track IDs. T1 through T7 are short display names used in the portfolio.
2. Read time and frame together. Saved times equal the recorded frame number divided by 25. The source video uses a different frame rate.
3. Read x, y, width, and height as percentages of the video area. The top-left corner is the position reference.
4. Preserve enabled states. They help control whether a box continues between saved positions.
5. Leave class names and decision reasons empty when they are absent from the source.
6. Do not infer a reason for a box position or a track ending. Ask Joy for the rule and her decision.

Checks completed

The conversion retained seven track IDs and 108 positions. Frames increase within each track, and every saved box has positive width and height. The reconstructed replay uses saved time rather than source video frame numbers.

The original clip, local videos, and shared Drive copy passed full decode checks. Selected images were inspected. The Drive copy downloaded without sign-in on 22 September 2026.

Annotation review still needed

Check each box against its intended object. Review identity changes, hidden objects, image edges, and track endings. Some boxes remain after vehicles leave. Five tracks have a final enabled state. No source annotation was changed during portfolio preparation.

Reference

Label Studio video object tracking documentation explains saved sequence positions and enabled states. It does not certify this project.
