Images from the shared video and saved track states

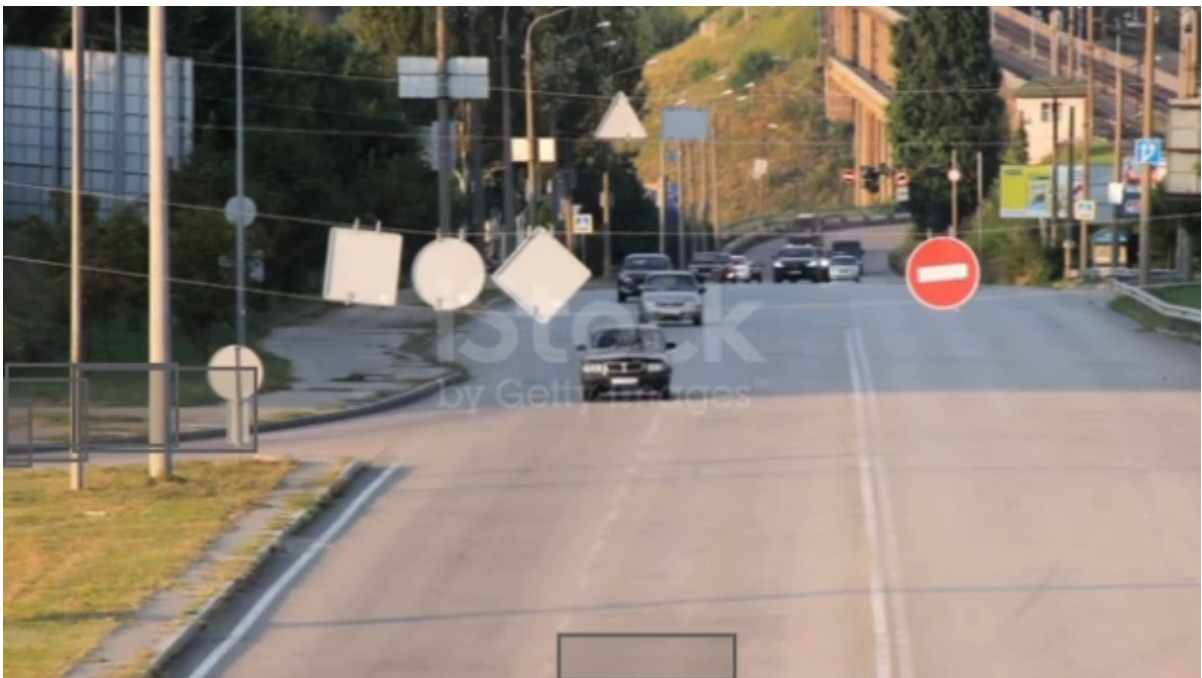

[Watch Joy's annotated video on Google Drive](#)

Early playback: 1 second

Several vehicles have visible boxes. This image comes from the shared Drive video. The source watermark is retained. A single image does not establish full tracking accuracy.

Later playback: 15 seconds

Boxes remain near the left and bottom edges after vehicles leave. Joy should review the track endings. This is an observed review item, not a corrected example.

Track boundaries and saved states

[Watch Joy's annotated video on Google Drive](#)

Track	Saved points	Last frame	Time (s)	Last state
T1	8	71	2.84	disabled
T2	5	41	1.64	disabled
T3	9	91	3.64	enabled
T4	32	331	13.24	enabled
T5	9	341	13.64	enabled
T6	24	261	10.44	enabled
T7	21	221	8.84	enabled

Example 1: disabled positions

T2 ends at frame 41, time 1.64 seconds, with enabled set to false. T1 ends at frame 71, time 2.84 seconds, with the same state. The export does not state why either change was made.

Example 2: the latest saved position

T5 has nine saved positions. Its last position is frame 341, time 13.64 seconds, with enabled set to true. A final enabled state does not prove that the box remains accurate to the end.

Example 3: saved detail

T4 contains 32 saved positions, while T2 contains five. These counts describe the sequences. They do not measure difficulty or annotation quality.

Corrections and feedback

The export contains no reviewer comments or per-position revision history. No before-and-after corrections or approval results are claimed.

Use Annotations.csv and Tracking data.json for the exact saved values. Video images and exported frame numbers use different time bases.
