

Video object tracking

Joy Gbadero | DataLens Africa | September 2026

[Watch Joy's annotated video on Google Drive](#)

Project and contribution

Joy created seven object tracks using Label Studio on DataLens Africa. Each track connects saved bounding-box positions for one object through the video.

Source clip	Object tracks	Saved positions
28.65 seconds	7	108

The export contains one submitted annotation. These counts describe the saved work. They do not establish an accuracy score or reviewer approval.

Watch the shared video

The linked video shows the scene and its annotation boxes. The Drive page and MP4 download were accessible without sign-in on 22 September 2026. The shared copy is 28.87 seconds long at 624 x 352 pixels.

What the portfolio contains

Annotations.csv contains all 108 saved positions. Tracking data.json retains the complete track records. Examples.pdf includes selected images from the shared video and a table of saved track states.

The original clip, the local DataLens recording, and a separate reconstructed box replay are included. The shared video differs in file size and resolution from the local recording.

Method and source record

Saved records contain track IDs, frame numbers, times, coordinates, box sizes, rotation, and enabled states. The export has no class names or written decision reasons.

The source clip has 687 frames at about 23.976 frames per second. The export records 716 frames and uses 25 frames per second for saved times. The reconstructed replay places boxes by saved time.

Review status

The video files passed playback checks. Some boxes remain after vehicles leave the scene. Joy needs to review those tracks. The original assignment rules are missing. No corrections, full accuracy review, or reviewer approval are claimed.

Read Sources and permissions.txt for the source record. Annotation guidelines.pdf is an export reading guide, not the original assignment rules.
